

A HISTORY OF EUROPEAN THOUGHT IN THE NINETEENTH CENTURY

by John Theodore Merz

Four-volume set \$11.00

The 19th century saw turning points and epochal discoveries in various branches of knowledge. The work of Faraday and Maxwell set the stage for the applications of electricity that have been responsible for so much of the pace and progress of the modern world. Darwin's theories effected a momentous revolution in many realms of human activity and experience. Marx's social and political ideas, in less than 100 years, have become supreme in nations containing half of the world's population. Kant, Spencer, Helmholtz, Gauss, Laplace, Malthus, Goethe, and J. S. Mill are only a few of the other thinkers who left permanent impress upon the shape of Western thought.

In this landmark study, John Theodore Merz thoroughly examines every major aspect of science and philosophy in England, Germany, and France during this century of intellectual ferment. Writing in the waning years of the century, Merz had a first-hand view of the origins and influences of new modes of thought in and upon the schools, ideas, and systems that were making the 19th century our first truly scientific age. And he had the rare skill of being able to summarize a tremendous amount of material and to organize it into a living picture of the contemporary scene. A work of astounding scope and depth, the book still manages to convey the excitement attendant upon the great discoveries and developing trends of thought.

The first two volumes, *Scientific Thought*, deal with scientific thought, covering mathematics and the natural sciences (astronomy, mechanics, physics, genetics, etc.). But Merz does much more than explain new ideas; he shows how these notions were reflected in and were influenced by literally hundreds of institutions, theories, and individuals: the French Academy of Sciences, the École Polytechnique, Monge's "descriptive geometry," the German universities, the ideal of "Wissenschaft," the English "liberal education," the Royal Institution, the Edinburgh Review, the atomic view of nature, the morphological view, Playfair, Babbage, Liebig, Johannes Müller, Riemann, Cantor, Cuvier, Humboldt, Fourier, Kelvin, Fechner, and much more.

Volumes III and IV, *Philosophical Thought*, are devoted to the philosophic views of the century, and here, too, the book's comprehensiveness is amazing. Individual chapters discuss the growth of the critical spirit and the development of ideas in ethics, metaphysics, theory of knowledge, aesthetics, social philosophy, and other areas. Names and concepts covered includes: Kant, German idealism, British Hegelianism, neo-Kantianism, pragmatism, Nietzsche, F. H. Bradley, Comte,

voluntarism, Ricardo, Sidgwick, Fichte, Schopenhauer, Lotze, Durkheim, society as an organism, the physiocrats, Bentham, monism, etc. These and countless other figures and ideas are discussed in detail.

These four volumes give you a superb text or outside reading for courses in the history of science or philosophy, the history of ideas, or for general humanities classes. They constitute an indispensable study and reference work and a mine of information for scholar, specialist, and student. Many subjects and individuals neglected or given short shrift in other comprehensive works are treated authoritatively and at useful length. Furthermore, the book's language is so straightforward, its organization so lucid, and its point of view so fresh, that any reader interested in the ideas that govern and mirror modern thought will find his understanding of the roots of those ideas immeasurably strengthened.

Complete, unabridged reprinting. Author's introductions. Indices in Vols. II and IV. Bibliography in footnotes. Total of lii + 2,716pp. 5 $\frac{3}{8}$ x 8. Each volume, Paperbound \$2.75

DOVER PUBLICATIONS, INC., 180 Varick St., New York, N.Y. 10014

Please send me the following books in the quantities specified:

.....Konzo, WINTER AIR-COND.	Clothbd. \$2.00
.....Lavoisier, ELEMENTS OF CHEMISTRY	\$3.00
Merz, HISTORY OF EUR. THOUGHT IN THE 19TH CENTURY:	
.....Volume I	\$2.75
.....Volume II	\$2.75
.....Volume III	\$2.75
.....Volume IV	\$2.75
.....Four-volume set	\$11.00

I am enclosing \$..... In full payment. Payment in full must accompany all orders except those from libraries and other public institutions, who may be billed. If your order is less than \$5, please add 10¢ to your remittance for postage and handling charges. Please print

A great new title in Dover's Classics of Science Library

ELEMENTS OF CHEMISTRY (Traité élémentaire de Chimie)

by Antoine Lavoisier

With a new introduction by Professor Douglas McKie

\$3.00

Antoine Lavoisier (1743-1794) is recognized as the principal founder of modern chemistry. When he discovered the compositions of air and water (he gave the world the term 'oxygen') and analyzed the process of combustion, he thereby bankrupted forever the phlogiston theory which had shaped thinking in the field for almost a century. Lavoisier also recognized chemical elements as the ultimate residues of chemical analysis and, with others, worked out the beginnings of the modern system of nomenclature. It is not too much to claim that chemistry's debt to Lavoisier is tantamount to physics' debt to Newton.

Nor is it hyperbole to compare Lavoisier's "Traité élémentaire de Chimie" with Newton's "Principia" in regard to the revolutionary effects each had in its field. The "Traité" (published in 1789) incorporates the notions of Lavoisier's "new chemistry" and carefully describes the experiments and reasoning which led Lavoisier to his conclusions. It was this book that first promulgated his theories widely and brought about their almost immediate acceptance in the scientific community. Only five years after the "Traité's" publication, Lavoisier was executed by a Revolutionary tribunal because of his association with the Farmers General—a tragic and incalculable loss to science.

Unabridged republication of the celebrated English edition

This is a reprinting of the famous English translation by Robert Kerr issued in 1780. Not a word is omitted in this edition. Part I covers the composition of the atmosphere, the composition and decomposition of water, and related experiments, one of which (on vinous fermentation) permits Lavoisier to make the first explicit statement of the law of the conservation of matter in chemical change.

The second part deals with the compounds of acids with various bases, and includes extensive tables of these compounds. Its most significant item however is the table of simple substances or elements—the first modern list of the chemical elements. The third section of the book reviews in detail the apparatus and instruments of chemistry and their uses. Some of these instruments, etc. are illustrated in the section of interesting plates at the end of the volume.

Not the least important feature of this new facsimile edition is the 27-page introductory essay prepared specially for Dover by Douglas McKie, University College, London, a leading historian of science and one of the foremost living authorities on Lavoisier. His book on Lavoisier's life and work is the standard study in the English language. Prof. McKie's introduction gives a survey of historical developments in chemistry leading up to the "Traité," describes Lavoisier's major contributions and his work in other fields, furnishes biographical information, and offers a critical evaluation of the significance of this book and its role in the history of chemistry. An original contribution in itself, this new essay helps to make this an authoritative, contemporary English-language edition of one of the premier classics of science.

Unabridged facsimile reprinting of original (1780) Kerr translation. Introduction written especially for the Dover edition by Prof. Douglas McKie, University College, London. Appendix: 10 tables. 13 double-page plates. 1 foldout. 2 charts. Total of 49 tables. lxxxii + 511pp. of text. 5⅝ x 8½. Paperbound **\$3.00**

WINTER AIR CONDITIONING

by S. Konzo, J. R. Carrol, H. D. Bareither

Original price **\$8.00**

Clothbound, Here only **\$2.00**

As any home owner or resident well knows, maintaining a comfortable room air temperature is a primary concern of daily living. And yet, it has always been difficult for the layman to get adequate information about heating systems: the technical works in the field are too difficult; and the sales literature and housing columns in newspapers are all too often unreliable, sometimes riddled with half-truths, misunderstandings, and out-of-date information. This valuable book supplies the answer to the problem by explaining the science of heating houses—the "how" and the "why"—simply and clearly, for the reader without any technical background.

Who can use this book?

home owners
future home owners
heating contractors
trainees

dealers
salesmen
installers
and many others!

More than 40 years of intensive research conducted under the best laboratory conditions and in specially designed research houses have gone into this book. With these excellent facilities at its disposal, the Department of Mechanical Engineering has thoroughly investigated

performance characteristics of various heating systems under actual operating conditions. Based on the findings of this study, this book gives any reader a thorough grounding in the problems of temperature, humidity, and physical comfort; house construction; heat conservation and loss insulation; ways of generating heat; and the steam, hot water, and warm air heating systems. Here is a book which will tell you how to get maximum comfort out of minimal expense.

Limited supply! Terrific 75% savings!

If you are planning to buy a house . . . or build one . . . or improve your present system for one reason or another, this book can save you hundreds and perhaps thousands of dollars. Even at its original price of \$8.00, this book would be a more than worthwhile investment for any present or future home owner. But now, through a special arrangement with the publishers, we can make this book available to our readers for only \$2.00, one-fourth of the original price. We have secured the entire stock of this valuable home guide. It is now available only from Dover, at this incredibly low price . . . as long as the supply lasts.

317 illustrations. 630pp. 6½ x 9.

Clothbound **\$2.00**

An exciting half-century of American cultural history, as seen through the camera's eyes! Now back in print . . .

PHOTOGRAPHY AND THE AMERICAN SCENE: A Social History, 1839-1889

BY DR. ROBERT TAFT

Late Professor of Chemistry, University of Kansas

\$3.00

In the 150 years since a British liner brought to New York a copy of *The London Globe* that contained details of an amazing new process named for its inventor, Louis Daguerre, photography has become the most universally practiced of all the arts and crafts, perhaps the most popular form of amusement ever devised. It caught on quickly and profoundly in the U.S. Yet surprisingly little has been done on its history here, or on evaluating its influence on American social, artistic, literary and even political life.

Thanks to the late Professor Robert Taft's interest, here is a book that fills in that serious gap. Published originally in 1939, it is still the best thing done in this area. As a result, out of print copies sell for as high as \$25 and \$35 on the rare book market, when they can be found at all. Now it is available at a fraction of that price in a completely unabridged Dover edition.

Over 300 illustrations! Dozens of rare, early photos!

In over 300 illustrations—including more than 250 early photographs, dozens of which had never before been published—and in a sparkling

text, the book tells the story of American photography in the half-century from 1839 to 1889; the 50 years during which it grew from an obscure (and often dangerous) stunt to the major means for recording the passage of history.

But more important, it also tells the story of America in that period as it was influenced and reported on by photography. The author describes the rise and fall of the daguerreotype, the ambrotype, the tintype, etc. He shows the evolution of two staples of 19th-century American life: the family photo album and the stereoscope. He depicts the elaborate studios of Matthew Brady, Napoleon Sarony, the Meade Brothers and writes about the fads and styles these and other early professional photographers set.

A vivid document of American cultural history!

The illustrations alone constitute an unforgettable outline of the American scene. There are beautifully reproduced daguerreotypes, card photos, tintypes, stereoscope slides, etc. showing such personalities as William Cullen Bryant, Fanny Davenport, Holmes, Audubon,

These illustrations greatly

reduced in size for this circular.

Presidents Fillmore, Pierce, Jackson, and Lincoln, and dozens of unidentified men, women and children dressed and posed in the height of fashion; such places as Harvard College, New York's Broadway in 1857, the ruins of Richmond after the Civil War, Boston from the air in 1860; and many of the great events of the era, including the building of the Union Pacific railroad, wagon trains heading West, Confederate dead at Gettysburg, the 1876 Philadelphia Centennial, and much more.

Of course, the technical aspect of photography's history is not ignored. As a chemist, Professor Taft was interested in early techniques and a lot of original research went into his book. Covering the entire period, up to the development of modern processes that make possible our picture magazines and newspapers and to early attempts to produce motion, he describes clearly the advances made by Draper, Wolcott, Morse, Muybridge, Hamilton Smith, Talbott and dozens of others. And his story of what happened when a bank clerk named George Eastman ruined his wardrobe by spilling photographic chemicals on it ushers in the era of rolled film and amateur photography.

Then, too, this is a book of surprising facts. For instance, did you know that a series of photographs led to the establishment of America's first national park, at Yellowstone? That a Matthew Brady photograph of Lincoln was an important factor in his election? That a photograph inspired Longfellow's classic "Hiawatha"?

Add to this more than 50 pages of notes, including hundreds of citations to previously overlooked or unknown sources; dozens of drawings showing early equipment, studio interiors, the kinds of newspaper illustrations used before photography, etc.; an appendix on restoring daguerreotypes; and a style of writing that is irresistible, and you have a book that will hold the interest of any reader, regardless of his special concerns.

Some reviews of the original publication!

"Well grounded and entertaining," NEW REPUBLIC. "As interest-

ing to students of American history as to students of the camera . . . illustrations are copious, rare, and really illustrative," NEW YORKER. "The writing is pleasant and the material exceptionally rich . . . sufficiently scholarly to qualify as a work of reference and sufficiently unprofessorial to qualify as a work of general interest," Norman Cousins, in CURRENT HISTORY. "He has set down for all time a thorough, pleasant and immediately valuable record. . . . Moreover, his book makes good general reading," Pare Lorentz, in the SAT. REVIEW.

Unaltered, unabridged republication of original (1938) edition. Introduction. Appendix: Restoration of Daguerreotypes. Bibliography. Notes. Indices: Illustrations, Subjects. 322 illustrations, xi + 546pp. 5 $\frac{3}{8}$ x 8 $\frac{1}{2}$. Paperbound \$3.00
